

Task 1.4 – Architecture Documentation
Student: Muhammad Islah Uddin
Date: September 17, 2026
Internship: Skill Set Go – Cloud & DevOps Track

1. Project Overview

I deployed a simple static website to Microsoft Azure using Azure Storage Account with Static Website hosting enabled.

2. Architecture Diagram (Text Version)

Explanation:

- Users access the website through a public URL.
- Azure Storage serves the index.html file directly.
- No virtual machine or server is needed (this is serverless static hosting).

3. Components Used

- Resource Group	: rg-week1-devops
- Storage Account	: islahdevopsweb26
- Static Website Feature	: Enabled
- Container	: \$web
- File Deployed	: index.html
- Live URL	: https://islahdevopsweb26.z1.web.core.windows.net/

4. Deployment Process Summary

1. Created HTML file locally on Ubuntu.
2. Created Resource Group in Azure.
3. Created Storage Account.
4. Enabled Static website hosting.
5. Uploaded index.html to the \$web container.
6. Website became publicly accessible via the Primary endpoint.

5. Benefits of This Architecture

- Very low cost (almost free on free tier)
- Highly available and scalable
- No server management required

- Fast content delivery
- Simple to maintain

=====

6. Conclusion

=====

This is a basic but production-style way to host static websites on Azure. It demonstrates understanding of cloud storage, static hosting, and basic cloud architecture.
